RESPONSIVE RESEARCH DASHBOARD - CODE AUDIT BEFORE IMPROVEMENTS

UI audit report

Audited: UX Analyzer: application shell, Overview, Sessions, calibration/recording flow, session details. Source-code review supported by the earlier screenshots in chat; no new rendered desktop/phone captures were available.

Needs polish

The original interface already has recognizable routes and useful session metrics. Small controls, weak status colours and a crowded phone header reduce usability. This score describes the original code, not a visual certification of the updated app. The fixes listed below have now been implemented; browser-based layout and assistive-technology verification remain outstanding.

Category scores

Contrast & readability 55

Original white-on-blue button text measured 4.02:1; updated teal measures 5.47:1.

Visual hierarchy 68

Original bright hero and multiple coloured tiles compete; updated page has one primary action and neutral metric cards.

Spacing & alignment 74

Content edges are consistent, but the original header has no phone reflow.

Typography 64

Original body/helper copy is often 12-14px, including at phone widths.

Touch targets 46

Original small buttons and icon-only tabs fall short of comfortable phone targets.

Consistency & clarity 65

Shared components help, but logo navigation, keyboard focus and completion states need work.

8 things to fix

1 Small button text and status colours need stronger contrast

High · Contrast & readability

WHERE

index.css primary colour; ui.jsx Button, Badge and StatTile

WHAT'S WRONG

White on the original #007AFF is 4.02:1, below the 4.5:1 target for ordinary button text. Bright green/orange status colours are also used for small labels and large values on pale surfaces.

WHY IT MATTERS

C1-C3 require readable text and meaningful graphics. Exact primary-button contrast was measured with the bundled Stroom script.

FIX

Implemented #0F766E primary (5.47:1 on white), #596579 helper text (5.90:1), dark status badge text and neutral metric values. The remaining chart/recording overlay colours still need a dedicated visual contrast review.

2 The header does not adapt to narrow phones

High · Spacing & alignment

WHERE

App.jsx original single-row header

WHAT'S WRONG

The wordmark, four full navigation labels and live status share a row without wrapping or a mobile alternative.

WHY IT MATTERS

S4 requires usable margins without crowding. P4 asks for actions that remain easy to reach on phones.

FIX

Implemented desktop sidebar, compact top bar, phone bottom navigation and consistent 16px phone content margins. The logo is now a home link, addressing K3 too. Rendered phone-width verification is still needed.

3 Touch targets and mobile tabs are cramped

High · Touch targets

WHERE

ui.jsx small buttons; SessionDetailPage.jsx tabs and back button; checkbox labels

WHAT'S WRONG

Original small controls can be around 28px tall, the back control is 32px wide, and phone tab labels disappear. Native checkbox hit areas are small without a padded label.

WHY IT MATTERS

P1-P3 call for comfortable targets, a 24px floor and separation between adjacent controls.

FIX

Implemented minimum 44px buttons, 48px standard actions, labelled scrollable tabs with 8px gaps and 44px checkbox labels. The back button is widened to 44px. Native media controls remain browser-managed.

4 Keyboard focus is explicitly suppressed

High · Consistency & clarity

WHERE

ui.jsx Button inline outline:none; application navigation

WHAT'S WRONG

Removing the default outline without replacing it leaves keyboard users without a reliable focus marker.

WHY IT MATTERS

K4 requires visibly distinct focus states; C3 also applies to the focus indicator.

FIX

Removed outline suppression, added a 3px teal focus-visible ring with 4px offset, added a skip link and respected reduced-motion preferences.

5 The dashboard has too many competing accents

Medium · Visual hierarchy

WHERE

DashboardPage.jsx hero, metrics and quick-action cards

WHAT'S WRONG

A saturated blue banner, coloured metrics, badges and coloured workflow cards all seek attention.

WHY IT MATTERS

H2 and H4 ask for importance to drive emphasis, with a small number of competing levels.

FIX

Implemented a quiet introductory hero, one primary Start a session action, secondary Explore sessions, neutral statistic cards and numbered workflow cards.

6 Important reading text is too small or too wide

Medium · Typography

WHERE

ui.jsx Alert and helper copy throughout the pages

WHAT'S WRONG

Body paragraphs often use text-sm (14px), with text-xs instructions at phone widths. Original alerts do not limit paragraph width.

WHY IT MATTERS

T1 recommends about 16px web body copy. T3 recommends a comfortable paragraph measure.

FIX

Implemented 16px body copy, at least 12px helper copy (13px on phones), clear page titles and a max-prose width for alerts.

7 Session identifiers obscure the useful information

Medium · Visual hierarchy

WHERE

DashboardPage.jsx SessionRow and ResultsPage.jsx session cards

WHAT'S WRONG

Long generated IDs are the main title, while the date is secondary. A session with zero gaze samples can look as complete as a session with valid eye tracking.

WHY IT MATTERS

H2 and K4 require important information and missing-data states to be recognizable.

FIX

Implemented date-first session titles, searchable date/ID, secondary ID metadata and an explicit No gaze data badge. Existing quality warnings and screenshot heatmaps are retained.

8 Calibration and saving need clearer handoffs

Medium · Consistency & clarity

WHERE

CalibratePage.jsx and RecordPage.jsx

WHAT'S WRONG

The calibration preview text says Enter begins recording although the calibration route only saves a model. Recording can show success before camera readiness or before saving finishes.

WHY IT MATTERS

K4 requires accurate progress and completion feedback next to the action.

FIX

Implemented save-calibration instructions, explicit success and Continue to recording, camera-readiness copy, pending request indicators and a saving state that prevents repeated Stop requests. These flows still need a real camera/browser acceptance test.

What's working

- **Recognizable workflow**
  Calibrate, Record and Sessions already express the main research tasks.
- **Reusable UI components**
  Shared buttons, cards, alerts and badges allow improvements to reach every page consistently.
- **Useful evidence alongside analysis**
  Session details retain screen playback, screenshot heatmaps, gaze quality and friction events.

The full checklist

10 passed · 14 failed · 1 can't tell

CONTRAST & READABILITY

C1	Body text contrast >= 4.5:1 Original primary button is 4.02:1; addressed with 5.47:1 teal.	× Fail
C2	Large text contrast >= 3:1 Bright status colours are used for original large metric values on pale surfaces; updated metrics use dark ink.	× Fail
C3	UI components and graphics >= 3:1 Some original status/graphic colours are too light. Shared controls improved; chart colours still require visual review.	× Fail
C4	Colour is not the only signal Status and friction badges have labels, not colour alone.	✓ Pass
C5	Text over images is readable Operational text is outside screenshot backgrounds.	✓ Pass

VISUAL HIERARCHY

H1	One clear primary action The original hero has one high-emphasis white Record button; no invented failure here.	✓ Pass
H2	Most important thing stands out most Original IDs and coloured tiles distract from useful dates and session completeness.	× Fail
H3	Clear heading structure Pages already use h1 and section headings.	✓ Pass
H4	Emphasis is used sparingly Original hero, metric colours and action cards compete. Neutral surfaces now reduce this.	× Fail

SPACING & ALIGNMENT

S1	Gaps come from one scale Tailwind spacing tokens give the original layout a repeatable base.	✓ Pass
S2	Labels sit closest to their own field The original audited pages contain few editable fields; no rendered field grouping was available.	– Can't tell
S3	Elements align to shared edges Main content uses shared containers and grids.	✓ Pass
S4	Consistent outer margins and breathing room Original header has no narrow-screen reflow; replaced with separate desktop/phone navigation.	× Fail

TYPOGRAPHY

T1	Body text is big enough Original 12-14px copy persists on phones; updated body text is 16px.	× Fail
T2	Clear type scale with few typefaces One system-font family and a small set of Tailwind sizes.	✓ Pass
T3	Line length about 45-75 characters Original full-width alerts can run long; updated alerts use max-prose.	× Fail
T4	Comfortable line height and alignment Body copy is predominantly left aligned with comfortable leading.	✓ Pass

TOUCH TARGETS

P1	Targets at least 44x44pt or 48x48dp Original small buttons and back control are undersized; minimums raised.	× Fail
P2	No target below WCAG 24x24px minimum Original native checkbox hit areas are small; updated labels have 44px hit height.	× Fail
P3	Enough space between targets Original segmented tabs have 4px gaps; updated gaps are 8px.	× Fail
P4	Key actions are easy to reach Original navigation is only at the top; phone bottom navigation added.	× Fail

CONSISTENCY & CLARITY

K1	Components are consistent Original shared components are a strong base; updated radii and heights are centralized.	✓ Pass

K2	**Labels say what happens** Start Calibration, Start Recording and Download PNG are task-specific labels.	✓ Pass
K3	**Familiar conventions** Original wordmark was not a home link; now uses a labelled Link.	× Fail
K4	**States and errors are clear** Original suppressed focus and ambiguous completion states were corrected. Full browser/assistive-tech verification remains outstanding.	× Fail
